helping save lives

Addressing the leading causes of perinatal mortality

At Laerdal, we are dedicated to helping save one million more lives, every year, by 2030. Through compassion, innovation, and partnership, we strive to advance women's health, helping healthcare personnel transform the way they work to improve both quality and efficiency.

Together with our partners, we help skilled health personnel to train on how to prevent and respond to some of the leading causes of morbidity and mortality on and around the day of birth. From postpartum hemorrhage, to prolonged and obstructed labor, newborn resuscitation and emergency c-sections, health personnel should be ready.

Training PPH scenario using the MamaNatalie simulator

TABU SURVIVED

After the delivery of her baby, Tabu suffered severe postpartum hemorrhage. Empowered by their scenario-based training with the Safer Births program, her health providers were able to manage this life-threatening complication. Tabu survived.

Scaling evidence-based solutions for impact

To empower skilled health personnel to provide quality care, we developed a bundle of innovative clinical, training, and quality improvement tools resulting from a decade of research and learning. The Safer Births innovations are currently being scaled up to over 100 facilities in Tanzania. Data from this implementation has shown more than 50% increases in perinatal survival.

Building competence and confidence

Every student should graduate with the competence and confidence to provide quality care. With a lack of clinical training opportunities still a challenge, our affordable [Maternity Training Kit](#) is designed to increase learner engagement through active participation. The kit can be used to develop communication skills and train the technical management of complications from shoulder dystocia through caesarean delivery with a standardized patient.

Respectful care during management of complications

One of the most important objectives during labor and delivery is recognizing the potential risks to both mother and baby. With [MamaBirthe](#), a well trained team can confidently manage adverse events and communicate with respect to the mother, ensuring better outcomes for both patients. Low and high-fidelity simulation-based training is ideal for practicing such scenarios, fostering good communication and respectful care.

Covering every stage of pregnancy

Monitoring the health of mother and baby is vital to ensuring a normal progression of pregnancy and safe delivery. With [VitalsBridge](#) and [Sonosim](#), monitor vital signs alongside highly realistic ultrasound. By using the two in tandem, obstetric emergencies can be identified early, making safe and fast intervention possible.

Interested in refreshing your obstetric skills and winning a prize? Visit the Laerdal booth to find out how! **F7**
